### TEST COMMENTS:

April dropped only 0.86" rain, and this corn after corn site was planted into very dry soils. The early dry conditions caused emergence differences and ear size to be smaller than normal. Dan stated that his corn on corn ground yielded 40-50 bushels less than after soybeans. The field around the plot site averaged about 185 bpa. Other area farmers confirmed the drop in yields after a previous corn crop, especially where residue had not been buried by tillage. One replicate of the early-season test was dropped, and the full-season test was rejected due to high variance.
