

Fertilizer Spreaders/Seeders

Through years of research Nordagri has achieved the best performance in fertilizer spreading with the introduction of this unit shown by its precision and it is user friendly. The gearbox is designed for years of performance with its temper steel gears operating in a grease reservoir. The spreading system is extremely simple, the fertilizer falling down directly from the bottom of the hopper, guaranteeing the best possible accuracy and also assures the complete distribution of fertilizer material which increases the life of the hopper. The spreading width is approx. 30' wide.

The vanes are made of stainless steel. The lever system can be easily maneuvered and allows a good distribution of material in the needed spreading directions. The model CN50 is 10 bushel capacity, available in the three point Category I model or in the ground drive or (pull type) model, which is ideal to be pulled by an all terrain vehicle or garden tractor which would not put tracks in your field like a heavy tractor would.
